                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Š
The present sequence encodes the human glial cell line-derived CC neurotrophic factor (GDNF) receptor, which can be used to treut CC dopaminergic nerve cell disorders, e.g. Parkinson's and Alzheimer's CC disease or amyotrophic lateral sclerosis, complications of dicherence and Huntington's disease and (optionally in combination with GDNF) CC and Huntington's disease and (optionally in combination with GDNF) CC diner ear sensory neurons. The receptor can also be used to highly compared GDNF activity, analyse GDNF related molecules and containing the pharmaceutical formulations. Receptor expression: CC cells, preferably transfected ex vivo, can be used similarly contained GDNF the use of the receptor CDNA in gene there, and contemplated. Probes based on the CDNA can be used to identify contained cells and tissues, e.g. to identify pathers and complex with the collabored transfected molecules that form a complex with the collabored transfected contained that form a complex with the collaboration, and to isolate molecules that form a complex with the collaboration and to isolate molecules that form a complex with the collaboration.
                                                                                                                                                                                                                                                                                                          Glial cell line derived neurotrophic factor receptor - useful treat dopaminergic nerve cell disorders, e.g. Parkinson's and Alzheimer's disease

The receptor binds GDNF specifically and with high affinity, acting as part of a complex that mediates/enhances signal transduction by GDNF, i.e. increasing dopamine uptake in dopaminergic cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PT isolated glial cell derived neurotrophic factor receptor alpha disorders, particularly enteric nervous system or kidney disorders products to diagnose and treat associated products of particularly enteric nervous system or kidney disorders products particularly enteric nervous system or kidney disorders products particularly enteric nervous system or kidney disorders produces. In Opp: English.

CC This DNA sequence comprises a fragment of a human EST-derived concern to the chentify glial cell derived neurotrophic factor receptor (GDNFR) sequences, including human variants. The invention relates to novel uses of GDNF and its receptor. In particular, it relates to novel uses of GDNF and its receptor. In particular, it relates to to rat GDNFR alpha, including agonist and neutralising antiodies, as well as various uses for these molecules. It also relates to assay systems for detecting ligands to GDNFR alpha, and creatifying gDNF-related conditions, methods for the physiological role of GDNF, diagnostic techniques for identifying gDNF-related conditions, methods for the treatment of GDNF-related and GDNFR alpha-related conditions, particularly kidney disease associated with GLONFR alpha and enteric nervous system related disorders.

CC Transgenic and knockout animals are also claimed.

CC This sequence comprises a partial cDNA for human Ret ligand (RetL) (RetL) (see W37458), a key component of the Ret signalling pathway. CC It was isolated from a human embryonic kidney cDNA library using CC v1 v247) for human retL1 cDNA as probe. A full-length sequence (see CV00247) for human retL1 cDNA has also been obtained, as well as containing retL1 DNA and prokaryotic or eukaryotic host cells containing retL1 DNA and prokaryotic or eukaryotic host cells cas a method for production of RetL1, its soluble variants and considering from vectors in vivo, is used to proteins with a toxin, imageable compound or radionuclide. CC RetL1, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue, conjury, neurodegeneration, motor neurone disease, multiple conjury, neurodegeneration, motor neurone disease, multiple conjury, neurodegeneration, motor neurone disease, multiple conjunctions (e.g. meningitis conjunctions end cerebral palsy, or conditions involved (e.g. meningitis conjunctions end cerebral palsy, or conditions involved (e.g. meningitis conjunctions end cerebral palsy, or conditions end (e.g. meningitis conjunctions end (e.g. meningitis

This sequence comprises CDNA coding for human Ret ligand (RetL)
RetLl (see W37459), a key component of the Ret signalling pathway.
It was deduced from 2 clones isolated from human foetal kidney
CDNA using primers based on a partial human retL1 cDNA (see
V0246). Rat retL1 and mouse and human retL2 and retL3 sequences
have also been identified (see V00245 and V00248-51). The human
CC retL1 cDNA is 88.2% identical to rat retL1 cDNA. Vectors
CC containing retL1 DNA and prokaryotic or eukaryotic host cells
CC transformed or transfected with these vectors are claimed, as well
as a method for production of RetL1, its soluble variants and
CC RetL1, optionally when expressed from vectors in vivo, is used to
CC promote growth of new tissue and survival of damaged tissue,
CC particularly kidney or neural tissue. Typical applications are in
CC renal failure, mephritis, kidney transplants, toxic or hypoxic
CC injury, neurodegeneration, motor neurone disease, multiple
CC sclerosis, bacterial, viral or prion infections (e.g. meningitis,
CC myelopathy associated with HIV or Creutzfeldt-Jakob disease),
CC cranial nerve or spinal cord injury, developmental disorders such
CC peripheral nervous system (Lyme disease, muscular dystrophy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           07-MAY-1997; U07726.

CC This cDNA sequence comprises the 3' end of mouse full-length color 26; the 5' end of the clone is given in cc gital cell derived neurotrophic factor receptor alpha (GDNFR alpha) cc (see W27327) clone 26; the 5' end of the clone is given in cc rat GDNFR alpha cDNA (see T84975) as probe. The invention relates cr to novel uses of GDNF and its receptor. In particular, it relates cc to notive rat GDNFR alpha (see W27327), its variants and soluble cc derivatives (extracellular domain), chimeric GDNFR alpha and cc antibodies which bind to the GDNFR alpha, including agonist and cc derivatives (extracellular domain), chimeric GDNFR alpha and cc molecules. It also relates to assay systems for detecting ligands cc domains in the physiological role of colors to diagnostic techniques for studying the physiological role of GDNFR alpha, systems for identifying molecules homologous to GDNFR alpha, and cc therapeutic techniques (claimed) for the treatment of GDNF related conditions, particularly kidney disease cc associated with glomerulonephritis and enteric nervous system cc claimed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening assay for modulators of syntaxin binding - using percent comprising binding site of syntaxin, for identifying drugs users. Since the since of syntaxin, for identifying drugs users. Since the since of syntaxin, for identifying drugs users. Since of comprising binding site of syntaxin, for identifying the protein. The invention relates to a method for identifying the capable of affecting the binding of a syntaxin-binding protein. The invention relates to a method for identifying the capable of syntaxin. The inventice of the test compound on the extention comprises measuring the effect of the test compound on the extention binding between the SBP and the SBP-binding site on syntaxin. The neutrone can be used for identifying drugs capable of inhibiting or stimulation of the suseful for treating CNS disorders, affective or psychotic disorders, neurodegenerative diseases, hormonal or immunological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers Example 8; Column 57-58; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequence having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect the repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic discussions commercial animal or plant breeding or pedigree analysis.

The repeats, when analysed, fall into 4 categories:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1815

2) imperfect repeats which are defined as 2 or more runs of uninterrupted CA repeats separated by no more than 3 consecutive non-repeat bases;
3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinucleotide or longer repeats of a sequence other than (dC-dA)n (dG-dT)n, or from at least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect This sequence is an example of a compound perfect repeat sequence of structure: (AC)20AG(AGAC)5AGA.

Sequence 65 BP; 33 A; 25 C; 7 G; 0 U;
                                                                                                                                                     having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g. paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf22 which contains the repeat sequence having the formula: (AC)20AG(AGAC)5AGA
                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers Disclosure; Column 9-10; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T65724 standard: DNA; 65 BP. T65724;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Repeat sequence from polymorphic marker clone Mfd22.

Statistics: Mean 34.889; Variance 136.192; scale 0.256

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Typical applications are in renal failure, nephritis, kidney transplants, toxic or hypoxic injury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, myelopathy associated with HIV or Creutzfeldt-Jakob disease), cranial nerve or spinal cord injury, developmental disorders such as Down's syndrome and cerebral palsy, or conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis). Fusion proteins are used to deliver toxins etc. to Ret-expressing

CC disease or amyotrophic lateral sclerosis, complications of diabetes of disease or amyotrophic lateral sclerosis, complications of diabetes cand Huntington's disease and (optionally in combination with GDNF) glaucoma, retinal degeneration and hearing loss caused by injury to compare ear sensory neurons. The receptor can also be used to block cunwanted GDNF activity, analyse GDNF related molecules and stabilise GDNF activity, analyse GDNF related molecules and cells, preferably transfected ex vivo, can be used similarly by cc implantation, and the use of the receptor CNA in gene therapy is complantation, and the use of the receptor CDNA in gene therapy is complantation, and the use of the receptor CDNA in gene therapy is complantation, and the use of the cDNA can be used to identify complantation, and the probes based on the cDNA can be used to identify complantation, and to isolate molecules, e.g. to identify patients who complete the complex with the cDNA or are homologous/cross-reactive with the cDNA. Anti-receptor complex of the receptor complex with the cDNA and animal complex with the cDNA and anim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                           pri useful to develop products to diagnose and treat associated fisorders, particularly enteric nervous system or kidney disorders of claim 1; Page 78-79; 100pp; English.

Claim 2; Potein comprises full-length rat glial cell derived for the receptor applied factor receptor alpha (BDNFR alpha), a novel green for gDNF its amino acid sequence was deduced from an isolated cDNA clone (see T84975). The invention related to novel uses of GDNF and its receptor. In particular, it convel uses of GDNF and its receptor. In particular, it could not the general page was additional and antibodies which bind to the GDNFR alpha, solution as an invention of the general page was additional and antibodies. It also relates to assay systems for detection the GDNFR alpha, systems for studying the physiological rolution of the general page was an included for identifying molecules homologous to GDNFR alpha, and the reader control to the treatment of GDNF-related control and gone in the gone general page (claimed) for the treatment of GDNF-related control and gone in the conditions and gone in the conditions and gone in the conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          13-MAR-1997; U04363.

The present sequence is the human glial cell line-derived neurotrophic factor (GDNF) receptor, which can be used to treat dopaminergic nerve cell disorders, e.g. Parkinson's and Alzheimer's disease or amyotrophic lateral sclerosis, complications of diabetes and Huntington's disease and (optionally in combination with GDNF) glaucoma, retinal degeneration and hearing loss caused by injury to inner ear sensory neurons. The receptor can also be used to block unwanted GDNF activity, analyse GNNF related molecules and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (AMGE-) AMGEN INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                          also contemplated. Probes based on the cDNA can be used to identify GDNF responsive cells and tissues, e.g. to identify pathents as would benefit from GDNF therapy, and abnormalities in receptor expression, and to isolate molecules that form a complex with the cDNA and animal complex with the cDNA or are homologous/cross-reactive with the cDNA and animal models that overexpress the receptor can be used to study the biological function of GDNF, knockout transgent animals can be used to detect GDNF dependent neurons or processes and the antibody can be used in immunoassays for the receptor. The receptor binds GDNF specifically and with high affinity, acting as part of a increasing depamine uptake in depaminergic cells.
                                                                                                                                                                                                                                                                                                                                                                               Matches

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Mon Mar 8 14:03:59 1999; MasPar time 23.85 Seconds 728.716 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: Sequence:

>US-08-866-354-36 (1-464) from US08866354.pep 3386 1 MILANVECLEFFLDDTLRSL.....RARPSAALTVLSVLMLKLAL 464

Scoring table: PAM 150 Gap 11

Searched: 116738 seqs, 37463448 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

Statistics: pir58 1:pir1 2:pir2 3:pir3 4:pir4 Mean 46.701; Variance 78.241; scale 0.597

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FEBS Lett. (1995) 358:119-125
A mitochondrial elongation factor-like protein is
over-expressed in tumours and differentially expressed
normal tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S68466

Claim 1; Page 82-84; 113pp; English.

This sequence comprises cDNA encoding human Ret ligand (RetL (see w37463), a key component of the Ret signalling pathway.

a composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250), obtained from the composite of partial clone GJ148 (see v00250).
                                                                                                                                                                                                                                                                                                                                                                (BIOJ) BIOGEN INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC adult spinal cord cDNA library. Rat and human RetL1, human RetL2 CC and mouse RetL3 sequences are also claimed (see W37457-62). Vectors CC containing retL3 DNA and prokaryotic or eukaryotic host cells CC transformed or transfected with these vectors are claimed, as well as a method for production of RetL3, its soluble variants and CC fusion proteins with a toxin, imageable compound or radionuclide. RetL3, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue, particularly kidney or neural tissue. Typical applications are in crenal failure, nephritis, kidney transplants, toxic or hypoxic conjury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, conjury associated with HIV or Creutzfeldt-Jakob disease), complopathy associated with HIV or Creutzfeldt-Jakob disease), complopathy associated with HIV or creutzfeldt-Jakob disease), secrosis, bacterial, viral or prion infections (e.g. meningitis, cas Down's syndrome and cerebral palsy, or conditions involving the companion of the compa

CC This sequence comprises a partial CDNA clone, designated GJ128, CC for human Ret ligand (RetL) RetL3 (see W37462), a key component of the Ret signalling pathway. It was isolated from a human adult CC heart cDNA library using a probe derived from a mouse retL3 partial CC cDNA (see V00256). A full-length sequence (see V00245-51). Vectors cretL3 CDNA has also been obtained, as well as rat and human retL1. CC human retL3 DNA and prokaryotic or eukaryotic host cells containing retL3 DNA and prokaryotic or eukaryotic host cells cransformed or transfected with these vectors are claimed, as well as a method for production of RetL3, its soluble variants and cretL3 components with a toxin, imageable compound or radionuclide. CC RetL3, optionally when expressed from vectors in vivo, is used to component failure, nephritis, kidney transplants, toxic or hypoxic crenal failure, nephritis, kidney transplants, toxic or hypoxic crenal failure, nephritis, kidney transplants, toxic or hypoxic crenal nerve or spinal cord injury, developmental disorders such cc cranial nerve or spinal cord injury, developmental disorders such cc partipheral nervous system (Lyme disease, muscular dystrophy and cc ctc. to Ret-expressing cells, especially tumours.

This sequence comprises EST AAO50083, identified as a partial cDr
for mouse Ret ligand (RetL) RetL3 (see W37455), by sceening of
an EST database with rat RetL1 (see W37457). A full-length
mouse retL3 cDNA clone (see V00249) was obtained by combining
AAO50083 with a clone obtained by 5'RACE. Rat, mouse and
human retL1, retL2 and retL3 cDNA sequences (see V00245-51) and
encoded polypeptides (see W37457-63) are claimed and can be used
in methods for promoting cell growth and improving survival of
cells, especially renal or neural cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence comprises a partial CDNA clone, designated GJ128, Cf for human Ret ligand (RetL) RetL3 (see W37462), a key component of the Ret signalling pathway. It was isolated from a human adult cheart cDNA library using a probe derived from a mouse retL3 partial CC DNA (see V00256). A full-length sequence (see V00251) for human retL3 cDNA has also been obtained, as well as rat and human retL1. CNA containing retL3 DNA and prokaryotic or eukaryotic host cells containing retL3 DNA and prokaryotic or eukaryotic host cells cransformed or transfected with these vectors are claimed, as well as a method for production of RetL3, its soluble variants and containing retL3 DNA and prokaryotic or eukaryotic host cells cransformed or transfected with these vectors are claimed, as well as a method for production of RetL3, its soluble variants and crasion proteins with a toxin, imageable compound or radionuclide. CC fusion proteins with a toxin, imageable compound or radionuclide. CC particularly kidney or neural tissue. Typical applications are in crenal failure, nephritis, kidney transplants, toxic or hypoxic conjury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, cc animal nerve or spinal cord injury, developmental disorders such as Down's syndrome and cerebral palsy, or conditions involving the creation of the creation are used to deliver toxins cetc. to Ret-expressing cells, especially tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and mouse RetL3 sequences are also claimed (see W37457-62). Vectors are containing retL3 bNA and prokaryotic or enkaryotic host cells transformed or transfected with these vectors are claimed, as well as a method for production of RetL3, its soluble variants and fusion proteins with a toxin, imageable compound or radionuclide. RetL3, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue, particularly kidney or neural tissue. Typical applications are in renal failure, nephritis, kidney transplants, toxic or hypoxic injury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, cranial nerve or spinal cord injury, developmental disorders such as Down's syndrome and cerebral palsy, or conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis). Fusion proteins are used to deliver toxins etc. to Ret-expressing cells, especially tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

Statistics:

Mean 11.743;

Variance 2.290; scale 5.129

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Statistics: Mean 34.299; Variance 146.727; scale 0.234

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RetL3, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue, particularly kidney or neural tissue. Typical applications are in renal failure, nephritis, kidney transplants, toxic or hypoxic injury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, myelopathy associated with HIV or Creutzfeldt-Jakob disease), cranial nerve or spinal cord injury, developmental disorders such as Down's syndrome and cerebral palsy, or conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis). Fusion proteins are used to deliver toxins etc. to Ret-expressing cells, especially tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
